

Bin marker dash rows

All three rows are identical

There is nothing to tell them apart, and nothing to bind in settings. A row is credited to whichever bin it appears nearest, because the camera and the bins do not move — which is the whole reason this design has no colour, no rhythm and no code in it.

Mount along the rim, inside

Where a shut drawer hides the row under the counter. Visible means open. Mount it level: the scan walks rows and columns, so a row lying flat or standing upright is found and one at an angle is not.

Five dashes is the threshold

A drawer reveals the row a dash at a time as it slides out from under the edge. Five dashes clear of it is what makes the bin read open — a legible rule rather than a threshold on a blur. To trigger sooner, print the dashes **smaller**, not fewer: five at a 4 mm pitch clear the edge in half the travel that five at 8 mm need. Fewer than five is not a setting — below that the room itself starts producing rows.

Which size to print

Start large and work down. The debug overlay reports the dash count, the pitch in samples, and how many scan lines crossed the row. Dashes hold up down to two samples of pitch, and this style reads the full luma frame rather than the half-size chroma grid the colour styles need — which is worth exactly double the distance. The row must be at least twelve samples tall, about 1.5 cm at this site.

An arm across it costs nothing

Repetition is the design. Covering the middle of the row leaves two shorter rows, and the longer one still answers.

Dash row — 3 mm dashes

20 dashes, 123 mm long, 22 mm tall. Reads once five dashes are clear of the counter edge — about 27 mm of travel. Print at 100%, matte stock.
